Project Report: Group 014-3

Application Name

Web-E-Vil

Group Members

Samuel Lauer, Sami Yohannes, Macallan Finigan, Denys Davydenko

Summary

Web-E-Vil was inspired by the social experiment, r/place, in which a community on the website Reddit, was dedicated to a large canvas where users were limited to one pixel change per 5 minutes, which prompted large scale community involvement to make flags, memes, and many other fun evolving pieces of art.

In Web-E-Vil, users are given a limited number of pixels a day to draw on a 1024x1024 canvas, which updates in real time for all other users. As users play more, they are rewarded with level ups. When a user levels up, they are given a token which they can use to unlock new color palettes from the palette store. Additionally, as they level up they're given more pixels to draw per day.

Users are given a protective bubble around any piece of art larger than 3 pixels, which stops players from over writing each others work, and allows interaction by just clicking on another users artwork, you can give them a like or dislike, and report the user. This also allows admin accounts to remove a specific piece of art, or ban a user which will then remove all of their work from the canvas.

Contributions

Samuel Lauer:

Technologies worked on- Docker/React/Express/NodeJS/Sockets. Using docker containers I made the web app and data base system, then using Sockets and NodeJS I connected them all together to make the Web-E-Vil application. I created the testing suite during Lab 10, and then iterated on that as development continued.
